### Exer.1

Denote the original r-s-flow and s-t-flow as  $f_{rs}$  and  $f_{st}$  respectively, we use them to construct a new r-t-flow  $f_{rt}$ , thus prove the transitivity of flow.

Let

$$f_{rt} = V \times V \to \mathbb{R} = \begin{cases} f_{rs}(u, v) & f_{rs}(u, v) \neq 0 \\ f_{st}(u, v) & f_{st}(u, v) \neq 0 \\ 0 & otherwise \end{cases}$$

Here V is the set of all vertices.

We just need to prove  $f_{rt}$  is a flow.

• Capacity constraint:

Case1:  $f_{rs}(u, v) \neq 0$ , then  $f_{rt}(u, v) = f_{rs}(u, v) \leq c(u, v)$ 

Case2:  $f_{st}(u,v) \neq 0$ , then  $f_{rt}(u,v) = f_{st}(u,v) \leq c(u,v)$ 

Case 3: Otherwise,  $f_{rt}(u, v) = 0 \le c(u, v)$ , since  $c(u, v) \ge 0$ 

• Skew symmetry:

Case1:  $f_{rs}(u, v) \neq 0$ , then  $f_{rt}(u, v) = f_{rs}(u, v) = -f_{rs}(v, u) = -f_{rt}(v, u)$ 

Case 2:  $f_{st}(u, v) \neq 0$ , then  $f_{rt}(u, v) = f_{st}(u, v) = -f_{st}(v, u) = -f_{rt}(v, u)$ 

Case 3: Otherwise,  $f_{rs}(u,v) = 0$ ,  $f_{st}(u,v) = 0 \Rightarrow f_{rt}(u,v) = 0$ 

 $f_{rs}(v,u) = -f_{rs}(u,v) = 0, f_{st}(v,u) = 0 \Rightarrow f_{rt}(v,u) = 0$ 

 $f_{rt}(u,v) = 0 = -f_{rt}(v,u)$ 

• Flow conservation:

For all  $u \in V/\{r, t\}$ ,

$$\sum_{v \in V} f_{rt}(u, v) = \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) > 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v) + \sum_{v \in V, f_{rs}(u, v) < 0} f_{rt}(u, v)$$

### Exer.2

First we prove the easy part, these two cases will not occur simultaneously. Prove it by contradiction.

Suppose both cases are true simultaneously, then there are k vertex disjoint paths  $p_1, ..., p_k$  from s to t. and there exists  $v_1, ..., v_{k-1}$  such that  $G - \{v_1, ..., v_{k-1}\}$  contains no s-t-path.

For any  $v_1, ..., v_{k-1}$ , the can take place in at most k-1 paths in  $p_1, ..., p_k$  since  $p_1, ..., p_k$  are disjoint vertex paths. Then we know there must be at least one path from  $p_1, ..., p_k$  left, which connects s and t, leading to a contradiction.

Next we prove that one of them must occur.

The second case is obvious since we can just remove all vertices except s, t from the V, then obviously there're no s-t-path now.

For the first case, we construct such network-graph. Edges connecting with s,t are assigned with  $\infty$  capacity so that it will not affect the inner flow. All other edges are assigned with capacity 1.

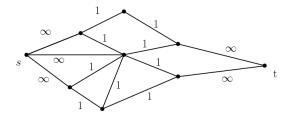

图 1: network

In such a network, the value of a flow is the number of vertex disjoint

paths in such a flow. Since the capacity of each edge is 1, we can know for sure that no two s-t-path cross with each other, otherwise there must be a vertex with units bigger than 1. Based on that, we see k, the value of a flow is the number of paths in it. Thus leading to k disjoint paths.
